Brian Meise

Selected Work 2016

L’Hunch

Role: UX / UI / Visual Design

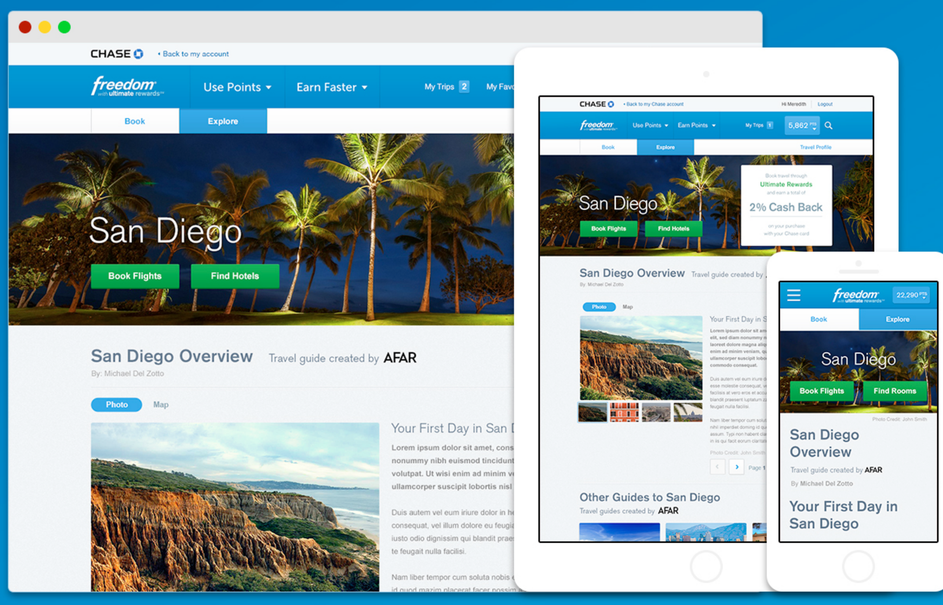

What the heck should I get for lunch today? This is the question my buddies and I always ask ourselves before settling on ordering the same dish from the same place, everyday. L’Hunch is how we chose to solve this. Upon landing on the site, L’Hunch offers you 1 lunch item from an eatery near you. You then can chose to next or accept it. Once you see a dish that you fancy, just click once and it automatically adds it to a new order on your seamless account. Simple as that!

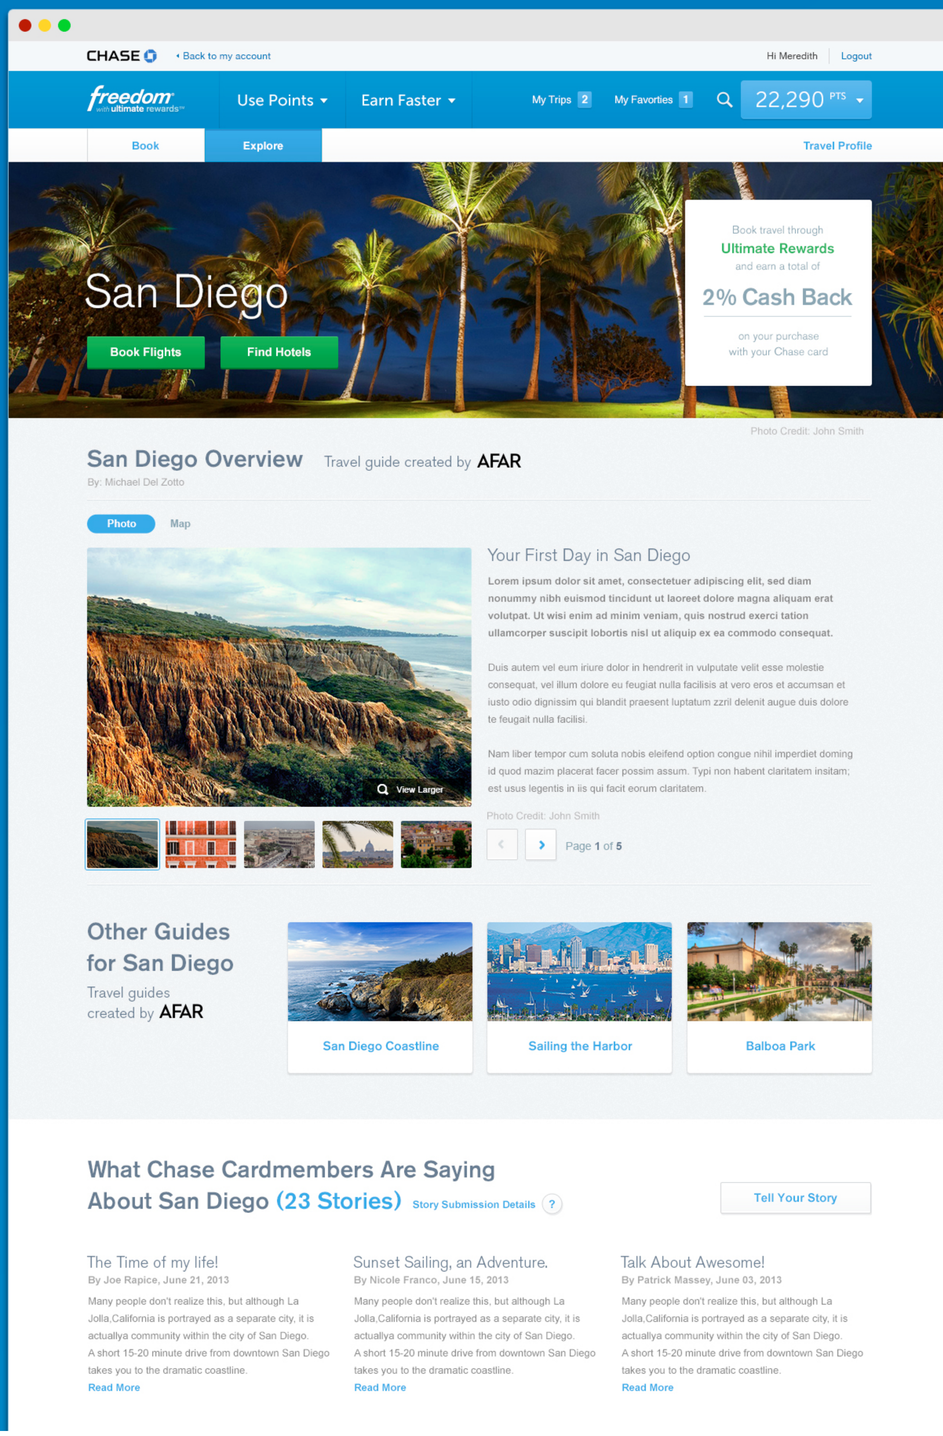

Chase Ultimate Rewards® Travel

Role: Visual Design / Design Management

Worked as the lead designer for Chase Ultimate Rewards® Travel. This was a year and a half long project that ended with a responsive and user friendly website consisting of hundreds of pages. There were numerous issues I had to solve such as: Setting up file naming conventions -- version control -- managing changes across PSDs for 3 screen sizes -- creating layercomps within the PSDs to ensure clarity for the development team -- creating redline documents that specified all of the spacing and dimensions of objects -- staying aligned with the other agencies working on the larger overhaul of Chase Ultimate Rewards® -- and managing a team of 3+ designers.

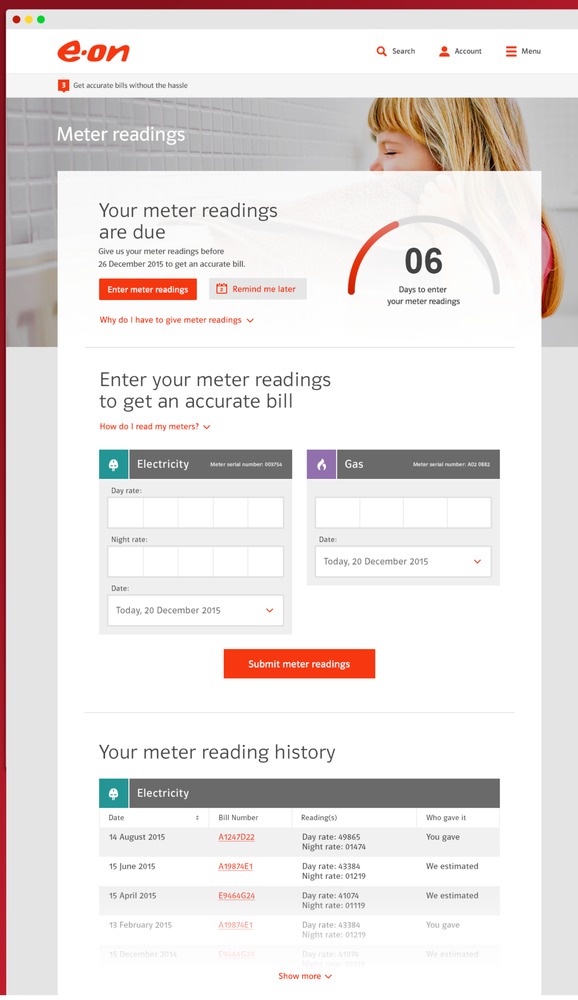

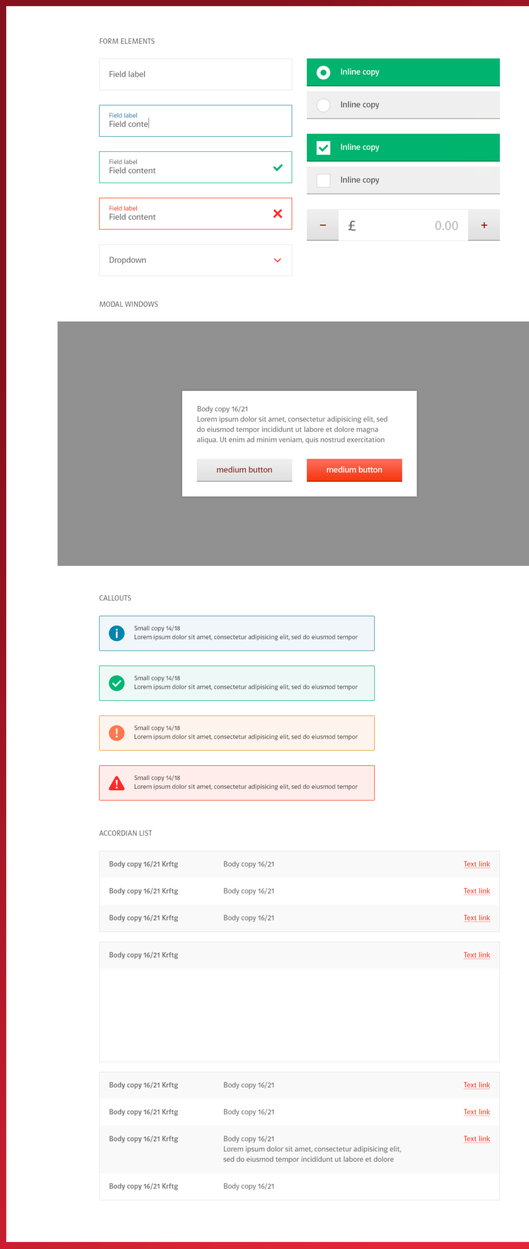

E.ON Energy

Role: UI / Visual Design

For one of the biggest energy suppliers in Europe, my agile team and I redesigned their website from the ground up. Starting with low fidelity prototypes for each of the key user journeys and user testing them we then iterated and built out high fidelity prototypes using real content. Next came creating a comprehensive style guide, UI kit and component library which made the developer lives much easier - ending with a fully functioning and highly usable responsive website.

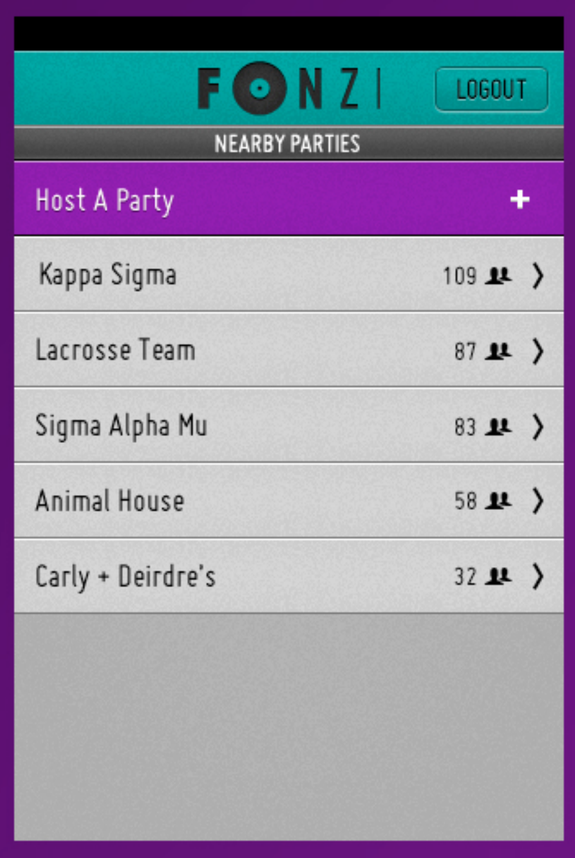

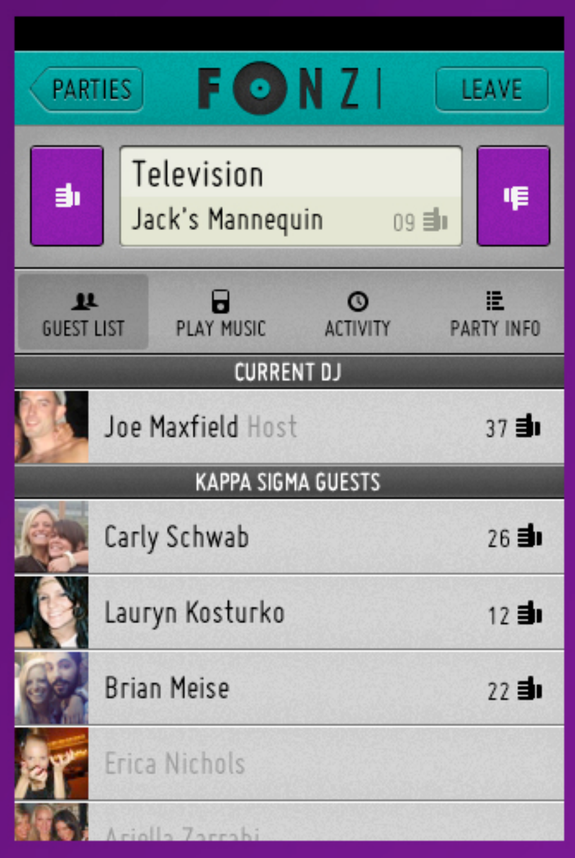

Fonzi (iOS app)

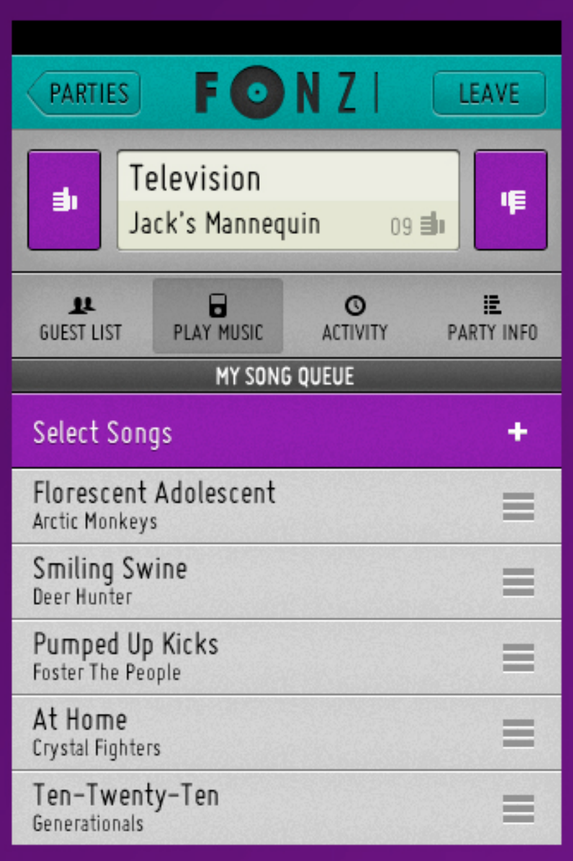

Role: UX / UI / Visual Design / Founder

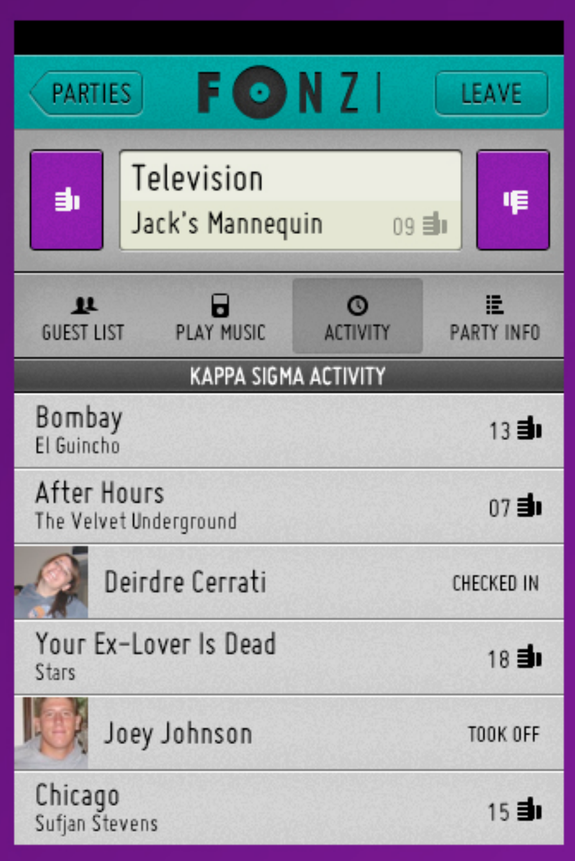

Fonzi was an iOS app I created and launched back in 2011. It was a mobile jukebox that allowed one person to plug their phone into some speakers and start playing their music. Other people nearby could then “join the party” and choose songs to add to the queue from their own mobile device.
After coming up with the idea with some buddies, I got a team to help me put this together and launched roughly 3 months later. While I got some good press initially, it never got enough traction to warrant the server costs and I had to shut down. On to the next one!

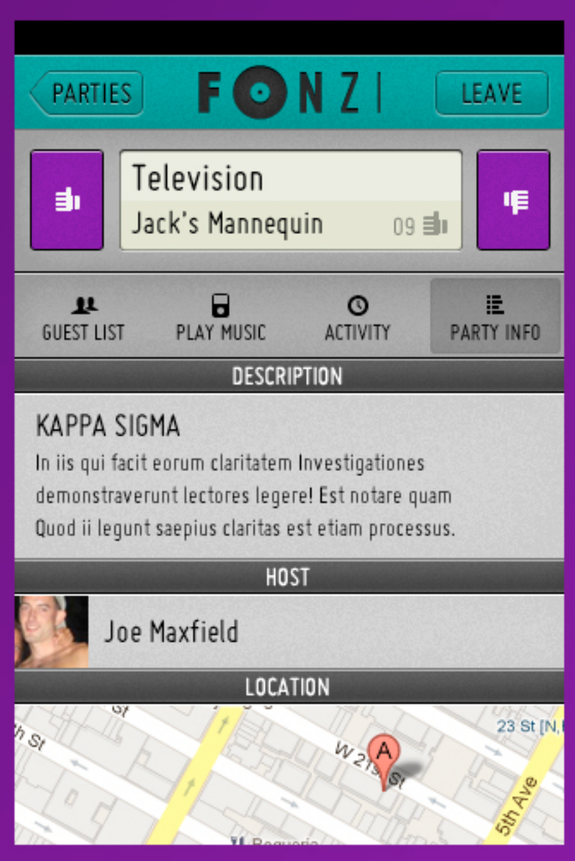

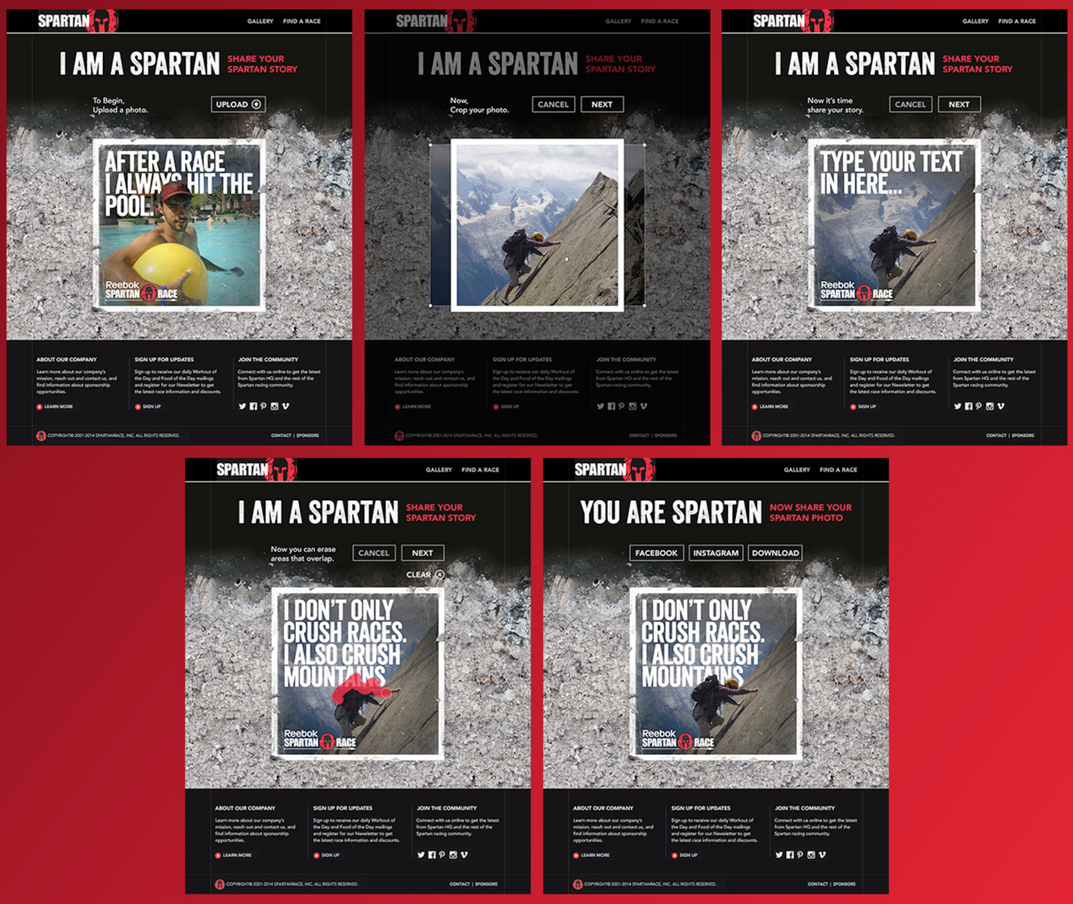

Spartan Race

Role: UX / UI / Visual Design **Demo:** http://i-am-spartan.herokuapp.com/

I teamed up with my developer buddy to build this website for Spartan Race. It allows racers to share their story in the form of a savable, spartanized image. Racers would land on the site and upload their own photo, which we would add the grunge effect to on the back end. They could then add type overtop of the image and erase parts of the type so it's partially hidden behind them in the photo. This resulted in unique content that could be shared across their social networks. In order to ensure that the user was instantly clear on the functionality, we created a demo that begins on the first image and loops until they decide to upload their own.
